

API EXPLAINED TO A 6 YEAR-OLD

Why is it useful?
↗

Think of an API like
the controls to a car.

Abi Bouhmaida
[@forgoodcode](#)

You've got a gas pedal to go forward, a brake pedal to stop, a steering wheel to turn, etc.

Abi Bouhmaida
[@forgoodcode](#)

You've also got information about the car, how fast it's going (speedometer), how fast the engine is turning (tachometer), how much gas is in the tank, etc.

Abi Bouhmaida
[@forgoodcode](#)

You don't need to know how the gas pedal makes the car go forward or the details of how the fuel tank reads its level.

Abi Bouhmaida
[@forgoodcode](#)

In fact, the 'under the hood' operation varies wildly from car to car,

Abi Bouhmaida
[@forgoodcode](#)

but since the car's interface is (roughly) the same, you can get in just about any car and drive it.

Abi Bouhmaida
[@forgoodcode](#)

The set of controls
and information is like
the car's API.

Abi Bouhmaida
[@forgoodcode](#)

"Turn this wheel to make the car go to the right. Look here to see how fast you're going."
is like a website's API saying, "Give me a string of text and the ID of a parent comment, and I'll post a reply to that comment".
